DATA SHEET

T 2517 EN

Type 41-73 Universal Excess Pressure Valve

Self-operated Pressure Regulators · DIN version

Application

Pressure regulators for set points from 0.05 to 28 bar \cdot Nominal sizes DN 15 to 100 \cdot Pressure rating PN 16 to 40 \cdot Suitable for liquids, gases and vapors up to 350 °C

The valve **opens** when the **upstream** pressure rises.

Special features

- Low-maintenance proportional regulators requiring no auxiliary energy
- Frictionless plug stem seal with stainless steel bellows
- Control line kit available for tapping the pressure directly at the valve body
- Wide set point range and convenient set point adjustment using a nut
- Exchangeable set point springs and actuator
- Spring-loaded, single-seated valve with upstream and downstream pressure balancing by a stainless steel bellows (K_{vs} ≤4: without balancing bellows)
- Soft-seated plug for strict shut-off requirements
- Low-noise plug (standard)
- All wetted parts free of non-ferrous metal

The universal excess pressure valves consist of a Type 2417 Globe Valve and a Type 2413 Diaphragm or Bellows Actuator.

Versions

Excess pressure valve for controlling the upstream pressure p_1 to the adjusted set point. The valve **opens** when the **upstream** pressure rises.

Type 41-73 · Standard version
Type 2417 Valve · Valve DN 15 to 100 · Metal-seated plug · Body made of cast iron
EN-GJL-250, spheroidal graphite iron EN-GJS-400-18-LT, cast steel 1.0619, forged steel or stainless steel 1.4408 · Type 2413 Actuator with EPDM rolling diaphragm

Version with additional features

Excess pressure valve with increased safety
 Actuator with leakage line connection and seal
 or two diaphragms and diaphragm rupture in dicator

Special versions

- Control line kit for tapping the pressure directly at the valve body (accessories)
- With internal parts made of FKM, e.g. for use with mineral oils
- Actuator for remote set point adjustment (autoclave control)
- Bellows actuator for valves DN 15 to 100 ·
 Set point ranges 2 to 6 bar, 5 to 10 bar, 10 to 22 bar or 20 to 28 bar
- Valve with flow divider ST 1 for particularly low-noise operation with gases and vapors (> T 8081)
- Version entirely of stainless steel
- Stainless Cr steel seat and plug with PTFE soft seal (max. 220 °C) or with EPDM soft seal (max. 150 °C)
- Stellite®-faced seat and plug for low-wear operation
- Version for industrial gases
- Free of oil and grease for high-purity applications
- FDA version 1)
- This version is not suitable for direct contact with products manufactured in the food and pharmaceutical industries. It can only be used close to the product.

Design and principle of operation

⇒ See Fig. 1

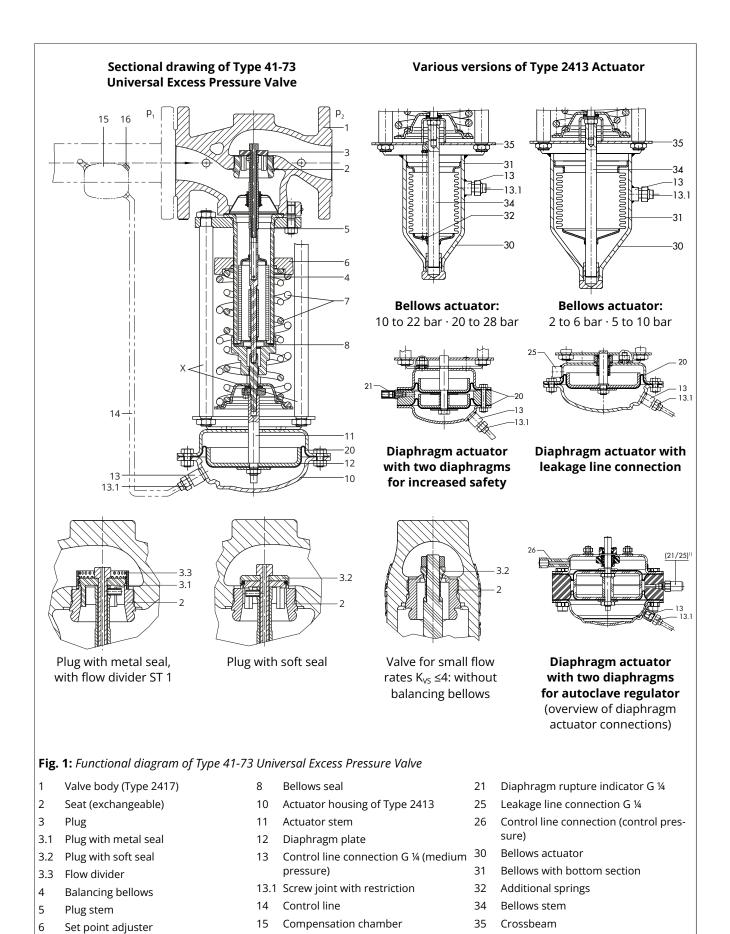

The medium flows through the valve (1) as indicated by the arrow. The position of the plug (3) determines the flow rate across the area released between plug and valve seat (2). The plug stem (5) with the plug (3) is connected to the actuator stem (11) of the actuator (10).

To control the pressure, the operating diaphragm (12) is tensioned by the set point springs (7) and the set point adjuster (6) so that the valve is closed by the force of the set point springs when it is relieved of pressure ($p_1 = p_2$).

The upstream pressure p_1 to be controlled is tapped upstream of the valve and transmitted over the control line (14) to the operating diaphragm (12) where it is converted into a positioning force. This force is used to move the valve plug (3) according to the force of the set point springs (7). The spring force is adjustable at the set point adjuster (6). When the force resulting from the upstream pressure p_1 rises above the adjusted set point, the valve opens proportionally to the change in pressure.

The fully balanced valve has a balancing bellows (4). The downstream pressure p_2 acts on the inside of the bellows, whereas the upstream pressure p_1 acts on the outside of the bellows. As a result, the forces produced by the upstream and downstream pressures acting on the plug are balanced out.

The valves can be supplied with flow divider ST 1. The valve seat must be replaced on retrofitting the flow divider.

Dimensional drawings

Installation

Normally, the valve is installed with the actuator suspended downwards. Install pipelines horizontally with a slight downward slope on both sides of the valve for drainage of the condensate.

- The direction of flow must match the arrow on the valve body.
- Adapt the control line to the conditions on site. The control line is not included in the scope of delivery. A control line kit is available for tapping the pressure directly at the valve body (see section Accessories).

i Note

For further details on installation in ► EB 2517.

Accessories

Included in the scope of delivery:

 Screw joint with restriction for control line with 6 mm diameter

To be ordered separately:

- **Compression-type fittings** for e.g. 8 mm or 10 mm pipe
- Control line kit optionally with or without compensation chamber.
 For direct attachment to the valve and actuator (pressure tapped directly at the valve body, for set points ≥0.8 bar).

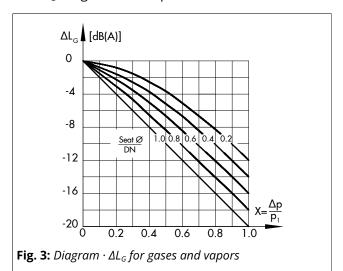

Compensation chamber for condensation and to protect the operating diaphragm against extreme temperatures. A compensation chamber is required for liquids above 150 °C as well as for steam.

i Note

For further details on accessories in \triangleright T 2595.

Valve-specific correction terms

ΔL_G for gases and vapors:

- ΔL_F · For liquids:

$$\Delta L_F = -10 \cdot (x_F - x_{FZ}) \cdot y$$

with
$$x_F = \frac{\Delta p}{p_1 - p_V}$$
 and $y = \frac{K_V}{K_{Vc}}$

Terms for control valve sizing according to IEC 60534, Parts 2-1 and 2-2:

- $\mathbf{F_L} = 0.95$; $\mathbf{x_T} = 0.75$
- **x**_{FZ} · Acoustical valve coefficient
- K_{vs}-1 · When a flow divider ST 1 is installed as a noise-reducing component
 Flow characteristic differences between valves with and valves without flow dividers do not occur until the valve has passed through approx.
 80 % of its travel range.
